

Cube Factory Simulation Workshop

Is it hard to imagine how the benefits others have achieved by “going lean” would actually work in your business?

This workshop is a lean simulation which will help you and your team to develop an understanding of the gains achievable through lean workplace management.

This simulation gives participants the opportunity to experience how lean tools can help to:

- Improve workflow
- Reduce Cycle time
- Improve Inventory control
- Improving Quality
- Improving Productivity and reducing frustration.

At the Cube Factory market conditions drive the “factory” to change the way it operates. The operation is a 5 stage process with all the problems of manufacturing a discrete product. In order to meet customer requirements the production crew must analyse the current situation and market requirements and then develop and implement a strategy to improve performance.

It is an active learning process that is designed to lead the participants through a journey of self discovery and understanding of lean tools work and to then explore how they could apply to your production process. The simulation can be customised to highlight particular tools and techniques and emphasis is placed on collecting and using data to make decisions and documenting improvement plans to improve performance.

Each simulation requires 10-12 people and more than one simulation can be run simultaneously.

Duration: One Day

Cost: \$5,000 + GST for SIRF Members
\$6,000 + GST for Non-Members
